CORNING

Total Support for a Total Solution
Assistance for your Cellular Integration

As the need for better indoor cellular signal has been increasing, many enterprise system integrators have not been able to deliver a solution to their customers.

To assist the integrator community with these requests, Corning has created the **Cellular Integration Support Program**. This program enables integrators to implement a total solution, all while informing and arming equipment and structured cabling installers with just what they need to cater to this market.

The system integrator ecosystem has ongoing working relationships and knowledge of its enterprise customer standards, facilities rules, and scheduling needs. This best positions system integrators for project management, scheduling, and on-site integration of the E-RAN system into the existing enterprise architecture.

The Cellular Integration Support Program includes:

- Corning's SpiderCloud® Enterprise Radio Access Network (E-RAN), an industry proven indoor cellular platform that is IT friendly and installs like a Wi-Fi network on Ethernet

- Project facilitation service managing mobile operator activities ensuring fast and effective responses

- National network of qualified and approved Corning cellular specialists to handle tasks required to design and commission cellular systems

- Post-installation support service ensuring prompt and accurate resolution of any issues
